Infrastructure Solutions

Top Reasons Why NetApp is Your Best Defense in Data Protection

RESPOND TO OPPORTUNITY

Delivers disk-to-disk backup for every environment

Whether you're looking to automate data protection at remote offices or increase the efficiency and performance of backup and recovery in the data center, we have a solution for you. NetApp® FAS storage with SnapVault® Snapshot™ based backup software automates and simplifies data protection, even enabling remote-to-core WAN backup. Our Virtual Tape Library (VTL) solutions dramatically increase performance and enable you to easily implement and manage a robust D2D2T architecture that consolidates and extends the usefulness of tape assets that are critical for compliance and disaster recovery.

Increases total storage efficiency by 95% or more

Backup is storage intensive. It requires you to maintain multiple versions of files so that you can recover back to different points in time. This is compounded by explosive data growth. That's why it's critical to maximize storage utilization.

NetApp is uniquely positioned to reduce capacity consumption on disk and tape storage as well as drive down power and cooling costs through innovative use of deduplication, tape smart sizing, and Snapshot based backup software. The result? Your backups consume significantly less capacity, power, and cooling.

Speeds backup and recovery up to 98%

To meet business requirements and prevent disruption to production operations, you need backups to complete successfully and finish fast. Fast recoveries are equally important. NetApp FAS backup solutions use snapshot-based, application-aware data protection to complete jobs faster, moving and storing only changed blocks so that backups complete in minutes rather than hours. Our VTL combines ease of integration with direct tape creation and unique shadow tape functionality to enable significantly faster creation of tapes for disaster recovery and high-speed recovery—even after you send tapes offsite.

Provides proven, reliable data protection

Disk-based and Snapshot™ based data protection are much more reliable than traditional tape-based backups. NetApp's common storage platform also helps to deliver the highest level of reliability. All primary and secondary storage systems leverage the same hardware architecture, so every customer benefits from our years of storage leadership. And because our solutions are based on 100% NetApp owned technology, you don't have to worry about external influences affecting product support and development.

Simplifies a complex world

Technology advancements, growing data levels, and expanding responsibilities can push backup and recovery staff into reactive mode. To help your team focus on more strategic initiatives, NetApp solutions are designed to be easy to integrate, expand, and monitor. We also help automate parts of your data protection lifecycle by integrating with leading backup application partners. The result is a solution that can reduce management complexity by 50% or even 75%.
